

AI GAME UPSCALER · DESKTOP APP

PixelForge Live

Play your games in crisp HD — even on an old GPU.

One click. Any game. No settings to tweak.

THE PROBLEM

Blurry games on modest PCs

1

Old or budget GPUs

Millions of gamers run laptops and entry cards that can't drive sharp, high-res visuals.

2

Upscaling is clunky

Built-in options are per-game, hard to find, or simply absent in older titles.

3

The best tool costs money

The popular desktop upscaler is paid and uses simple filters, not a trained AI model.

PixelForge Live fixes all three: free, one-click, and AI-powered.

THE SOLUTION

Sharper games, instantly

Works with any game

Launch your game, launch PixelForge Live, play.
No per-game configuration.

Trained on game art

An AI model that understands textures and edges — not just a blur-and-stretch filter.

Runs on your GPU

Smooth, real-time upscaling. Your game and your data stay on your machine.

WHY IT STANDS OUT

Smoother AND smarter

Full HD, 60+ FPS

65 FPS at 1080p on a laptop RTX 3050
— fluid, not a slideshow.

Real AI model

Trained on game textures; keeps text
and edges clean where simple filters
smear.

Free & open

The leading alternative is paid.
PixelForge Live is free and the code is
open.

Same frame, same moment — PixelForge (right) keeps the HUD text and detail crisper than a plain filter (middle).

GET IT

*Try it, or let's build your
version*

For gamers

Free download, run it on any offline game. One click to sharper visuals.

For studios & devs

Want AI upscaling tuned to your game's art, or built into your engine? I take that on.

For me

Freelance AI / ML engineer — real-time model deployment, from research to shipped app.
